

## Top nitrogen feed

**TARGET NITROGEN:** ilMix Green COVER N is a green manure mixture designed to maximize the supply of nitrogen to the crop in succession.

Hairy vetch, Crimson and Squarrosium clovers, which are among the most effective nitrogen fixers among winter legumes, result in a low C/N ratio. The mineralization of the organic substance is faster, and the nitrogen is "ready" and available for following crop.

The Brown mustard is an effective trap for nitrates that will be made gradually available to following crop.

### COMPOSITION (4 SPECIES)

Hairy vetch, Crimson clover, Squarrosium clover, Brown mustard

### USAGE

Field crops, Orchard

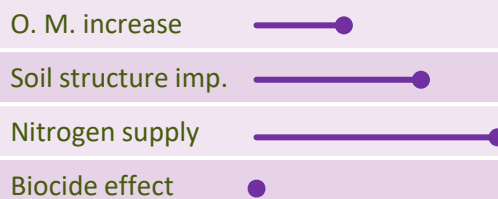

### SEEDING RATE

25 – 30 Kg/ha

### SOWING PERIOD

September – November

### BENEFITS

### TERMINATION

End of April – beginning of May
