

FAST N

Nitrogen quickly

EARLY NITROGEN NUTRITION

Product designed to have maximum growth by winter. It must be sown no later than the first days of September (better the second half of August) in order to develop in Autumn. Frost sensitive.

The low carbon/nitrogen ratio favors rapid degradation of the biomass with high availability of the nutritional elements of the cover already for the following crop.

COMPOSITION (4 SPECIES)

Berseem clover, Fenugreek, Brown mustard

USAGE

Field crops, vegetables

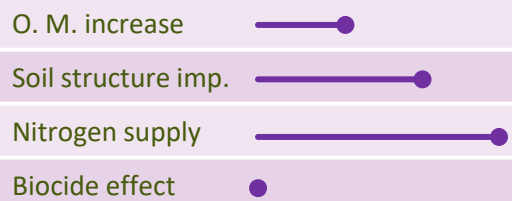

SEEDING RATE

30 – 35 Kg/ha

SOWING PERIOD

Late Summer and Spring

BENEFITS

TERMINATION

In Winter (for late Summer sowings)
