

Perennial green cover of inter-rows

COMPOSITION (5 specie): Perennial rye grass (turf type), Red fescue, Festuca r. tricophylla/Ovina, Poa pratensis, White clover.

BENEFITS

USAGE TYPE

Perennial green cover of inter-rows of vineyards and orchards

SOWING PERIOD

Autumn and Spring

SEEDING RATE

60 - 80 Kg/ha

Perennial green cover composed of perennial grasses able to compete and limit weeds throughout the year. Thanks to the short height and the compact radical development, they avoid excessive competition with the orchard for water resources and reduce the number of inter-row maintenance interventions. The addition of dwarf white clover, thanks to the rhizomatous root system ("chain"), guarantees an excellent anti-erosive function and bearing capacity.
